

AIDD-30-DAYS-CHALLENGE-TASK-2

PART A :

NINE PILLARS UNDERSTANDING

Q1: Why is using AI Development Agents (like Gemini CLI) for repetitive setup tasks better for your growth as a system architect?

AI Development Agents jaise Gemini CLI repetitive setup tasks ko automate kar dete hain, jisse aapka time aur energy bacha rehta hai. Is se aap boring manual kaamon mein phasne ke bajaye system design, architecture planning aur strategic decision making par focus kar sakte hain. Yehi skills aapko system architect banne mein madad deti hain, aur aapki growth fast hoti hai.

Q2: Explain how the Nine Pillars of AIDD help a developer grow into an M-Shaped Developer.?

Nine Pillars of AIDD developer ko M-Shaped banne mein is tarah madad karte hain:

- Repetitive kaam AI ko dekar developer system design aur strategy par focus karta hai.
- Deep skills jaise architecture, security, integration develop hoti hain.
- Saath hi broad skills jaise AI tools, DevOps, and cloud ka exposure milta hai.
- Is balance se developer ke paas depth bhi hoti hai aur breadth bhi, jo M-Shaped skills ka matlab hai.

2. Vibe Coding vs Specification-Driven Development

Why does Vibe Coding usually create problems after one week?

Vibe Coding ek hafta baad problems is liye create karta hai kyun ke ismein planning aur discipline nahi hoti.

AI se banaya gaya quick code pehle kaam karta hai, lekin dheere dheere errors, bugs aur technical debt jama hone lagte hain. Phir us code ko maintain karna mushkil ho jata hai

3. How would Specification-Driven Development prevent those problems?

Specification-Driven Development clear planning aur structure deta hai.

Is se AI ya developer ka code consistent, tested aur error-free hota hai. Har cheez pehle se defined hoti hai, is liye bugs aur confusion ka chance kam ho jata hai.

Q3. Explain why developers must think in layers and systems instead of raw code.

Developers ko layers aur systems mein sochna chahiye kyunki sirf raw code likhne se sirf ek chhoti problem solve hoti hai.

Lekin jab aap layers (jaise UI, logic, data, security) aur systems ke hisaab se sochte hain, to aap poore software ka structure samajhte hain. Is tarah aap scalable, maintainable aur efficient solutions design karte hain — jo ek architect ki thinking hoti hai, sirf coder ki nahi.

PART C MCQS:

What is the main purpose of Spec-Driven Development?

- A. Make coding faster
- B. Clear requirements before coding begins ☒
- C. Remove developers
- D. Avoid documentation

2. What is the biggest mindset shift in AI-Driven Development?

- A. Writing more code manually
- B. Thinking in systems and clear instructions ☒
- C. Memorizing more syntax
- D. Working without any tools

3. Biggest failure of Vibe Coding?

- A. AI stops responding
- B. Architecture becomes hard to extend ☒
- C. Code runs slow
- D. Fewer comments written

4. Main advantage of using AI CLI agents (like Gemini CLI)?

- A. They replace the developer completely
- B. Handle repetitive tasks so dev focuses on design & problem-solving ☒
- C. Make coding faster but less reliable
- D. Make coding optional

5. What defines an M-Shaped Developer?

- A. Knows little about everything
- B. Deep in only one field
- C. Deep skills in multiple related domains
- D. Works without AI tools
